

Specifications:

This large bin-Tipper is a productive hydraulic tipping machine which enables the continuous flow of product.

This Machine is hydraulic driven to compliment low maintenance costs.

The bins enter on a chain which is driven by a three phase 0.55kW motor or on roller systems.

The Bins then enters the tipping frame, where the bin is rotated to almost 180 degrees, forcing the product out of the bin and into a hopper.

The hopper then moves the product into the pack line for production.

The Large Bin Tipper can tip up to 300 bins per day, which is very competitive in the industry.
